

Adding a JDK to your eclipse IDE (MS windows only)

You should follow the instructions below to point your Eclipse IDE to the JDK installed on your MS Windows machine:

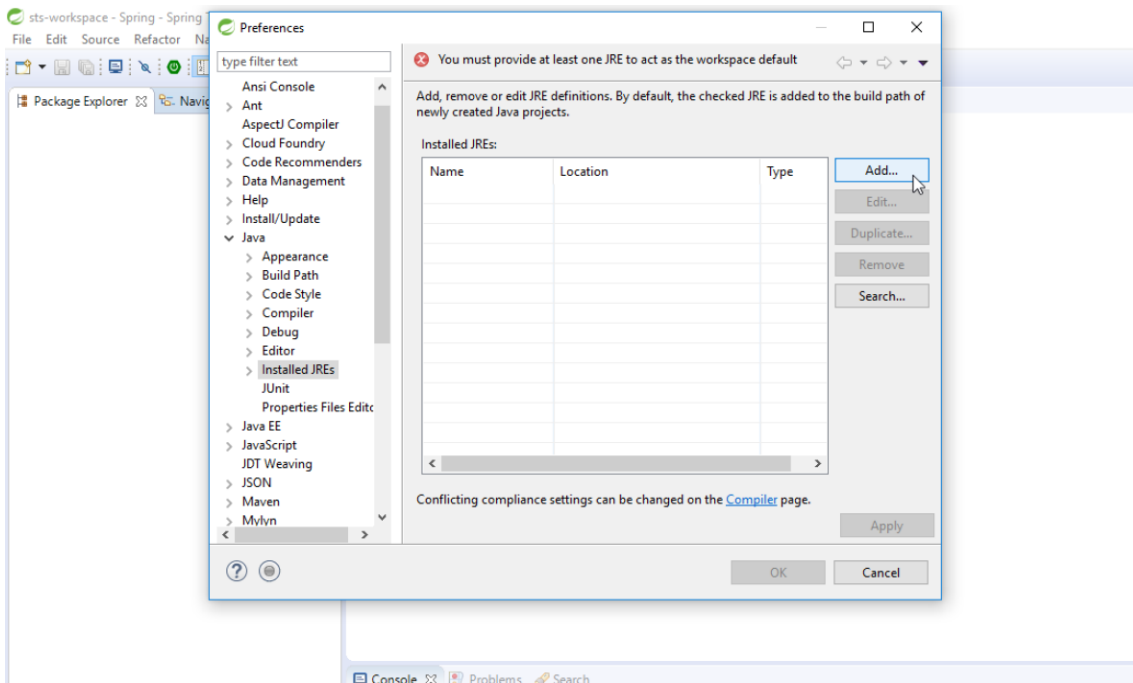

1. Within Eclipse, click on the pulldown menu Window > Preferences

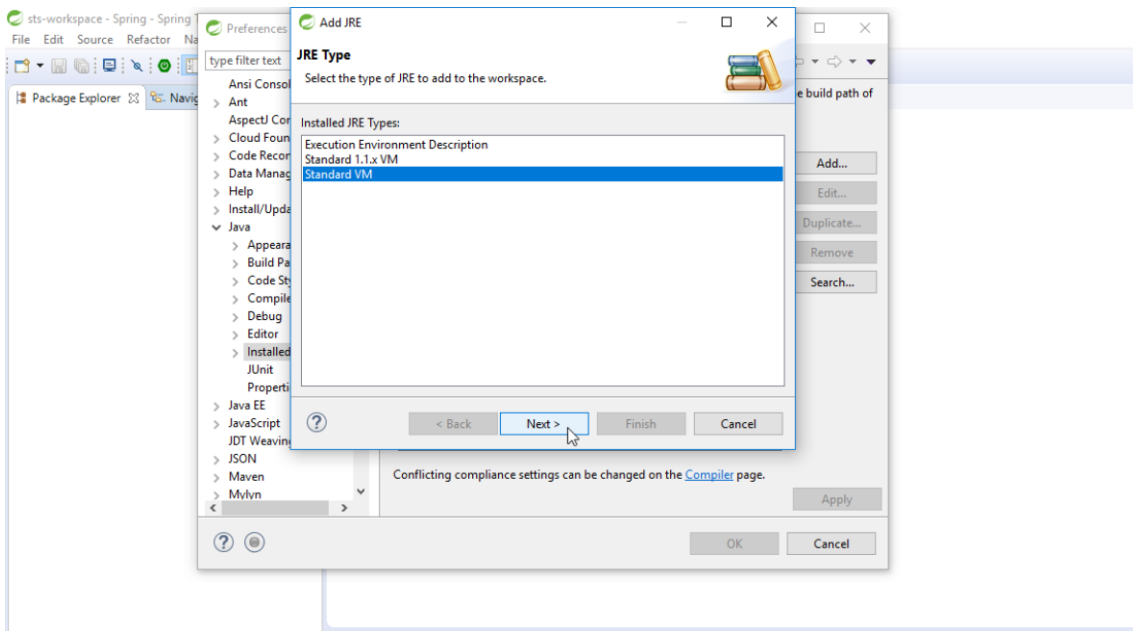

2. On the left side, select Java > Installed JREs, and "Remove" all the JDK/JRE configurations that may already be there.

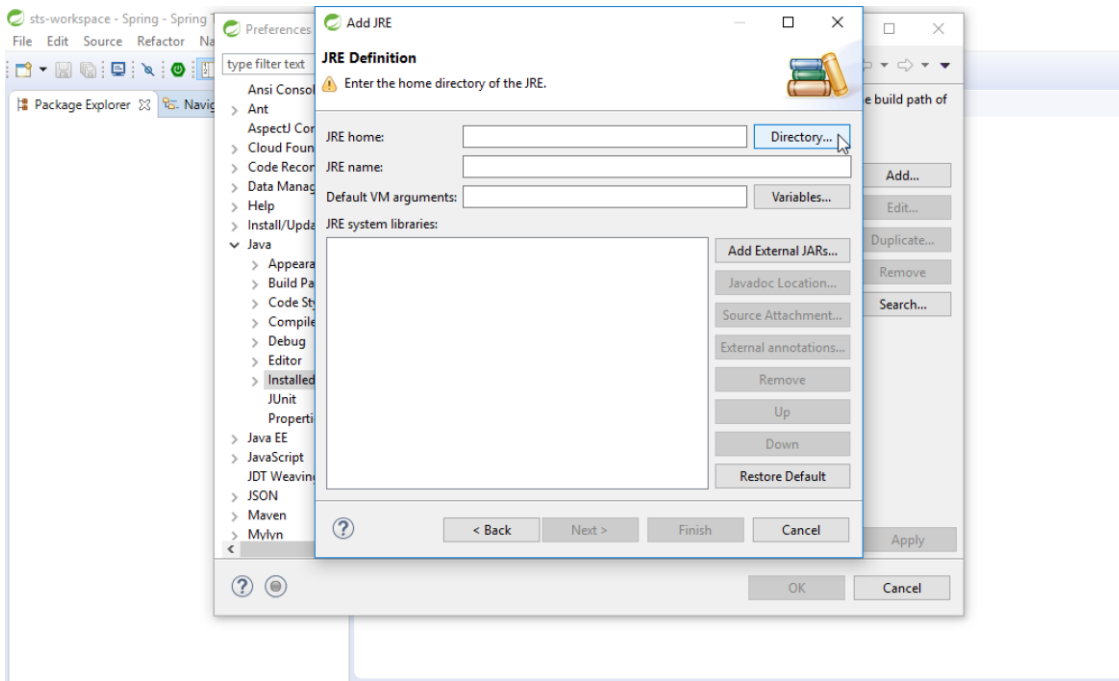

3. After you finished removing all Java JDK/JRE configurations, the resulting screen will appear as follows. Click the Add... button.

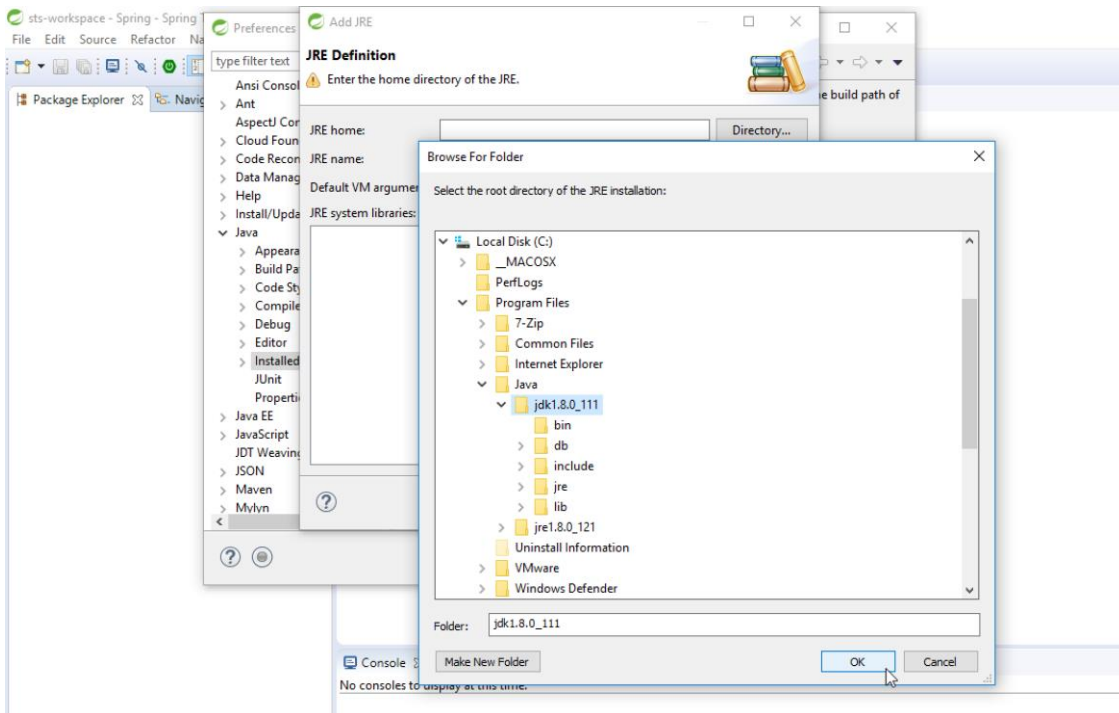

4. Select Standard VM, then click Next >

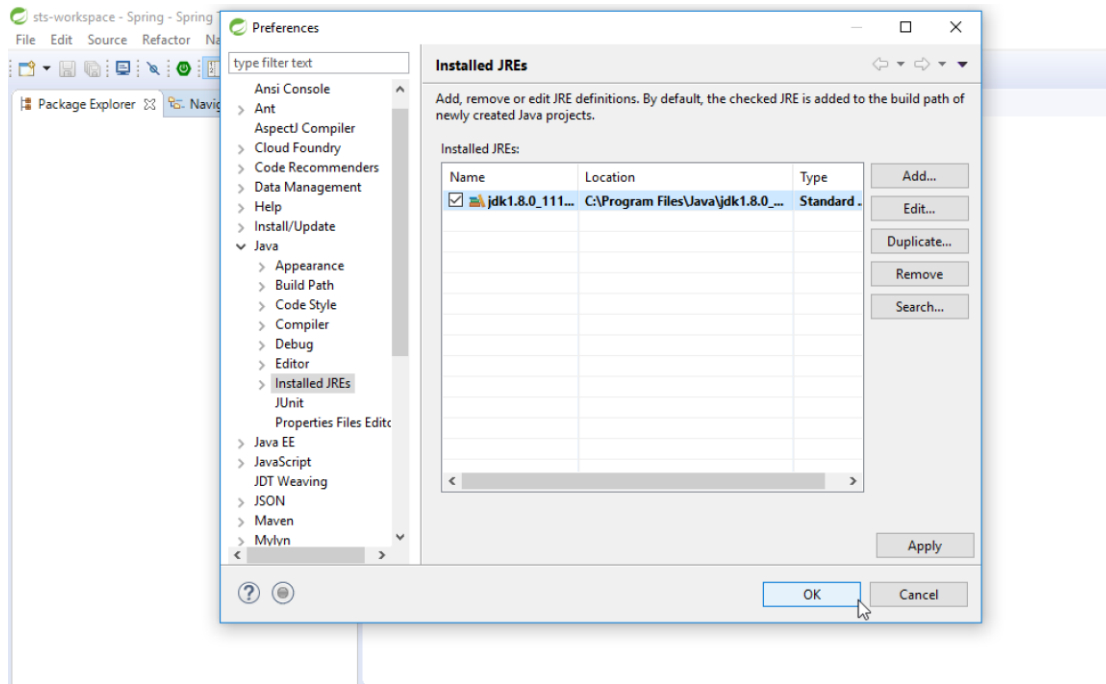

5. In the **JRE Definition** screen, click Directory...

6. Point to your JDK installation folder. On MS Windows, it is usually a folder akin to the one shown in the picture below. Click OK.

7. Afterwards, click Finish and you will return to the Preferences window. Mark the checkbox corresponding to your JDK configuration (the only one available in the list), as shown below. Click OK.

Your IDE should be properly configured now.
